

Dear Berton Earnshaw,

I am excited to apply for the open position of Machine Learning Intern with Recursion Pharmaceuticals. This position sounds like an ideal fit for me as I would be able to combine my skills in building (ml)machine learning models and my analytical thinking. I admire how the Recursion team is audaciously taking on a dual mission of curing rare diseases, and changing the way that drug discovery itself is done. I feel that I would fit in as I share both an intellectual curiosity as well as a desire to move the field of human biology forward. With my strong background in data modeling and ml, I would love to work to solve these problems that will help those in need.

While working for an automated parking robotics company, I was able to cultivate my interest for solving complex real-world problems. I created memorable relationships as I worked side-by-side to help the team accomplish our goals. This ability to work with others, coupled with a determination to learn and build things, allowed me to work in many departments with varying technical difficulties. I believe that my experience will help accomplish the large goals that the Recursion team has set out to accomplish. My experience in cultivating workplace relationships and technical skills give me a unique approach to the open position in machine learning.

Thank you for your consideration. I'm excited to use my experience in Tensorflow as well as building ml models to contribute to the Recursion team. I look forward to speaking with you and presenting my work.
